- D2: DATABASE WPI Section Ch, Week 198537 Derwent Publications Ltd., London, GB; Class A96, AN 1985-226925 XP002150017 & JP 60 147651 A (SEKISUI CHEM IND CO LTD), 3 August 1985 (1985-08-03)
- D3: WO 96 30764 A (VORWERK CO INTERHOLDING ;POCH HEIKE (DE); SAUER RALF (DE); SINCLAI) 3 October 1996 (1996-10-03)
- D4: CAYOT P., TAINTURIER G.: 'The Quantification of Protein Amino Groups by the Trinitrobenzenesulfonic Acid method: A Reexamination' ANALYTICAL BIOCHEMISTRY, vol. 249, 1997, pages 184-200, XP002150016

Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step r industrial applicability; citations and explanations supporting such statement

- 1. Novelty (Art.33(2) PCT) and Inventive step Art.33 (3) PCT)
- 1.1 With respect to claim 1

Document D1 is regarded as being the closest prior art to the subject-matter of claim 1, and shows a method of detecting the level of protein in dust (page 1, lines 3-6), comprising:

providing a dust sample (page 5, lines 19, 20);

liberating from the dust sample at least one component selected from the group consisting of aliphatic amines and aliphatic amino acids (page 1, line 8, "liberating amino acids); determining the relative concentration of the liberated at least one component (page 1, line 9-11 "... detection of amino acids"); and providing an indication of allergen activity (page 1, line 19) in dependence upon relative concentration determined (page 1, lines 3-25).

The subject-matter of claim 1 therefore differs from this known in D1 in that breakdown components of proteins or peptides are extracted without subjecting to degradation by proteolytic enzyme and liberation of amino acids and that the extracted at least one breakdown component is reacted with a colorimetric amine detection reagent and the intensity is quantitatively measured of any resulting coloration, the allergen activity being proportional to the intensity of coloration. The subject-matter of claim 1 is therefore novel (Article 33(2) PCT).

INTERNATIONAL PRELIMINARY InterEXAMINATION REPORT - SEPARATE SHEET

The problem to be solved by the present invention may therefore be regarded as to provide a method to determine allergen activity of a dust sample due to the dust mite activity.

None of the documents D1-D4 describes the **extraction** of **breakdown components of proteins or peptides** and their detection by a colorimetric method. Nor does any of the documents cited indicate that the mere detection of breakdown components and peptides already liberated by proteases contained in the sample excreted from mites could be used as an indicator for allergen activity due to mite activity. In contrast D1 and D3 determine the total protein content of a dust sample not distinguishing from the already existing breakdown components. None of the documents cited gives a hint that the breakdown components are an indicator for allergen activity in dust samples, due to the activity of the mite originating proteases. Therefore claim 1 is inventive.

1.2 With respect to claim 16

The same as discussed under item 1.1 applies to independent claim 16. Moreover none of the references cited describes a method of determining allergen activity in dust comprising the step of providing a protease substrate having immobilized thereon proteins or peptides labelled with a chromogenic substance and quantitatively measuring the breakdown components as claimed in claim 16.

- 1.3 Claims 2-15 and 17-20 are dependent on claims 1 or 16 respectively and as such also meet the requirements of the PCT with respect to novelty and inventive step.
- 1.4 With respect to claim 21

None of the references cited describes or gives an indication to set up such a kit apparatus comprising

- a first chamber comprising a surfactant
- a second chamber comprising a colorimetric amine detection reagent
- means for quantitatively measuring the intensity of any coloration resulting from reacting the extract-containing surfactant and the colorimetric amine detection reagent;
- and means for indicating relative level of allergen activity in the dust sample based on the quantitative measurement. Therefore claim 21 is new and inventive

INTERNATIONAL PRELIMINARY **EXAMINATION REPORT - SEPARATE SHEET**

International application No. PCT/GB00/02100

(see also item 1.1).

1.5 With respect to claim 29

The only feature which characterizes the apparatus of claim 29 is a substrate having immobilized thereon proteins or peptids labelled with a chromogenic substance. A person skilled in the art for example working in the field of biosensors uses proteins labelled with chromogenic substances to test the ability of surfaces to bind proteins, for example to test for nonspecific binding. Therefore surfaces having immobilized thereon proteins labelled with a chromogen are known to a person skilled in the art. Thus claim 29 is not new.

1.6 With respect to claim 30

Albumin is a protein which is inexpensive, commercially available and the azogroup is commonly used to covalently couple a further component to the protein or to immobilize the protein, therefore claim 30 does not contain any features which, in combination with the features of claim 29 to which it refers, meet the requirements of the PCT in respect of inventive step.

Re Item V

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

- Novelty (Art.33(2) PCT) and Inventive step Art.33 (3) PCT) 1.
- 1.1 With respect to claim 1

Document D1 is regarded as being the closest prior art to the subject-matter of claim 1, and shows a method of detecting the level of protein in dust (page 1, lines 3-6), comprising:

providing a dust sample (page 5, lines 19, 20);

liberating from the dust sample at least one component selected from the group consisting of aliphatic amines and aliphatic amino acids (page 1, line 8, "liberating amino acids); determining the relative concentration of the liberated at least one component (page 1, line 9-11 ".. detection of amino acids"); and providing an indication of allergen activity (page 1, line 19) in dependence upon relative concentration determined (page 1, lines 3-25).

The subject-matter of claim 1 therefore differs from this known in D1 in that breakdown components of proteins or peptides are extracted without subjecting to degradation by proteolytic enzyme and liberation of amino acids and that the extracted at least one breakdown component is reacted with a colorimetric amine detection reagent and the intensity is quantitatively measured of any resulting coloration, the allergen activity being proportional to the intensity of coloration. The subject-matter of claim 1 is therefore novel (Article 33(2) PCT).

EXAMINATION REPORT - SEPARATE SHEET

The problem to be solved by the present invention may therefore be regarded as to provide a method to determine allergen activity of a dust sample due to the dust mite activity.

None of the documents D1-D4 describes the extraction of breakdown components of proteins or peptides and their detection by a colorimetric method. Nor does any of the documents cited indicate that the mere detection of breakdown components and peptides already liberated by proteases contained in the sample excreted from mites could be used as an indicator for allergen activity due to mite activity. In contrast D1 and D3 determine the total protein content of a dust sample not distinguishing from the already existing breakdown components. None of the documents cited gives a hint that the breakdown components are an indicator for allergen activity in dust samples, due to the activity of the mite originating proteases. Therefore claim 1 is inventive.

1.2 With respect to claim 16

The same as discussed under item 1.1 applies to independent claim 16. Moreover none of the references cited describes a method of determining allergen activity in dust comprising the step of providing a protease substrate having immobilized thereon proteins or peptides labelled with a chromogenic substance and quantitatively measuring the breakdown components as claimed in claim 16.

1.3 Claims 2-15 and 17-20 are dependent on claims 1 or 16 respectively and as such also meet the requirements of the PCT with respect to novelty and inventive step.

1.4 With respect to claim 21

None of the references cited describes or gives an indication to set up such a kit apparatus comprising

- a first chamber comprising a surfactant
- a second chamber comprising a colorimetric amine detection reagent
- means for quantitatively measuring the intensity of any coloration resulting from reacting the extract-containing surfactant and the colorimetric amine detection reagent;
- and means for indicating relative level of allergen activity in the dust sample based on the quantitative measurement. Therefore claim 21 is new and inventive

EXAMINATION REPORT - SEPARATE SHEET

(see also item 1.1).

1.5 With respect to claim 29

The only feature which characterizes the apparatus of claim 29 is a substrate having immobilized thereon proteins or peptids labelled with a chromogenic substance. A person skilled in the art for example working in the field of biosensors uses proteins labelled with chromogenic substances to test the ability of surfaces to bind proteins, for example to test for nonspecific binding. Therefore surfaces having immobilized thereon proteins labelled with a chromogen are known to a person skilled in the art. Thus claim 29 is not new.

With respect to claim 30

Albumin is a protein which is inexpensive, commercially available and the azogroup is commonly used to covalently couple a further component to the protein or to immobilize the protein, therefore claim 30 does not contain any features which, in combination with the features of claim 29 to which it refers, meet the requirements of the PCT in respect of inventive step.

15

CLAIMS

1. A method of determining allergen activity in dust, comprising:

providing a dust sample;

5 extracting from the dust sample at least one breakdown component of proteins or peptides;

reacting the extracted at least one breakdown component with a colorimetric amine detection reagent; and

quantitatively measuring the intensity of any 10 resulting coloration, the allergen activity being proportional to the intensity of coloration.

- 2. A method according to claim 1, further comprising exposing the dust sample to a protease substrate, the protease substrate having immobilised thereon a protein or peptide on which protease in the dust sample may act.
- 3. A method according to claim 2, further comprising adding a protease inhibitor to the dust sample to suppress activity of a specific protease prior to exposure to the protease substrate.
- 4. A method according to claim 2, in which the protease substrate is protease specific, with only a specific protease being able to act on the protein or peptide immobilised on the substrate.
- 5. A method according to claim 2,3 or 4, in which the protease substrate comprises a filter to facilitate extraction of mobile breakdown components of the protein or peptide immobilised on the protease substrate.
 - 6. A method according to any one of claims 1 to 5, in

5

15

1

which the breakdown components extracted from the dust sample include amines, amino acids or peptides present in the dust sample.

- 7. A method according to any one of claims 1 to 6, in which the colorimetric amine detection reagent is 2,4,6-trinitrobenzene sulphonic acid, (hereinafter referred to as TNBSA)
- A method according to any one of claims 1 to 7, in which the at least one breakdown component is extracted
 by bringing the dust sample into contact with a surface active agent (surfactant).
 - 9. A method according to claim 8, further comprising separating any dust sample solid residues from the surfactant prior to reacting with the colorimetric detection reagent.
 - 10. A method according to claim 8 or 9, in which the surfactant is an aqueous solution comprising sodium dodecyl sulphate.
- 11. A method according to claim 10, in which the aqueous 20 solution is alkaline.
 - 12. A method according to claim 10 or 11, in which the aqueous solution further comprises sodium hydrogen carbonate.
- 13. A method according to any one of claims 1 to 12, in 25 which the intensity of any resulting coloration is quantitatively measured by comparison with at least one reference colour.
 - 14. A method according to claim 13, in which different

5

15

20

colour references are selected to indicate at least three different kinds of allergen activity.

- 15. A method according to any one of claims 1 to 14, further comprising preserving the reaction mixture by using a stopping agent after a pre-selected incubation period.
- 16. A method of determining allergen activity in dust, comprising:

providing a dust sample;

providing a protease substrate, the protease substrate having immobilised thereon proteins or peptides labelled with a chromogenic substance;

exposing the protease substrate to the dust sample under conditions whereby a protease in the dust sample may act on the immobilised protein or peptide to produce mobile breakdown components labelled with the chromogenic substance:

and quantitatively measuring the intensity of any resulting coloration, the allergen activity being proportional to the intensity of the coloration.

- 17. A method according to claim 16, further comprising adding a protease inhibitor to the dust sample to suppress activity of a specific protease prior to exposure to the protease substrate.
- 25 18. A method according to claim 16, in which the protease substrate is protease specific, with only a specific protease being able to act on the proteins or peptides immobilised on the substrate.

- 19. A method according to claim 16,17 or 18, in which the protease substrate comprises a filter to facilitate extraction of mobile breakdown components labelled with the chromogenic substance.
- 5 20. A method according to any one of claims 16 to 19, in which the intensity of any resulting coloration is quantitatively determined by comparison with at least one reference colour.
- 21. Kit apparatus for use in a domestic environment for indicating allergen levels in dust, comprising a first 10 chamber comprising a surfactant for extracting from a dust sample at least one breakdown component of proteins and peptides; a second chamber comprising a colorimetric amine detection reagent; means for quantitatively 15 measuring the intensity of any coloration resulting from reacting the extract-containing surfactant the colorimetric amine detection reagent; and means for indicating relative level of allergen activity in the dust sample based on the quantitative measurement.
- 20 22. Kit apparatus according to claim 21, further comprising a filter for filtering dust sample solid residues from the surfactant before reacting with the colorimetric amine detection reagent.
- 23. Kit apparatus according to claim 21 or 22, in which
 25 one of the two chambers has the capacity to receive the
 contents of the other chamber.
 - 24. Kit apparatus according to claim 23, in which the second chamber has the capacity to hold the colorimetric

amine detection reagent and the surfactant.

- 25. Kit apparatus according to any one of claims 21 to 24, in which the quantitative measuring means comprises at least one colour reference, against which the
- 5 intensity of any coloration may be compared.
 - 26. Kit apparatus according to any one of claims 21 to 24, in which the indicating means comprises a scale, which is linked to the intensity of any coloration measured.
- 27. Kit apparatus according to any one of claims 21 to 24, further comprising a third chamber comprising a stopping reagent to limit the reaction between the extract-containing surfactant and the colorimetric amine detection reagent.
- 28. Kit apparatus according to any one of claims 21 to 27, in which the colorimetric amine detection reagent is 2,4,6-trinitrobenzene sulphonic acid.

Apparatus for use in determining allergen levels in

- a dust sample, comprising a protease substrate having immobilised thereon proteins or peptides labelled with a chromogenic substance, whereby any protease in the dust sample may act on the immobilised proteins or peptides to
 - produce mobile breakdown components labelled with the chromogenic substance.
- 25 30. Apparatus according to claim 20, in which proteins labelled with chromogenic the substance comprise azoalbumin.
